Our services include products that are traded on margin and carry a risk that you can lose more than your initial deposit. The products may not be suitable for everyone – please ensure you fully understand the risks involved. GFT Markets is a trading name of GAIN Capital – FOREX.com UK Limited and is authorised and regulated by the Financial Conduct Authority. FCA No. 190864. Revised 13 March 2014.

† Tick Factor = the price increment representing 1 whole trading unit, by which P&L and both initial and variation margin is calculated. The Notional Value of your underlying transaction is Price * Number of CFDs/Tick Factor.

†† Note: WTI Crude Oil options expire a month earlier than the contract month suggests. E.g. WTI Crude Oil options for contract month November would expire 6 business days before the 25th calendar day of October. If the 25th calendar day of the month prior to the contract month is a non-trading day, then expiry will be 7 business days before the 25th calendar day of the month prior to the contract month.

*IM Factors in respect of Options on a cfd will be margined by way of GFT's Delta-Vega margining system. This system will take in to consideration any positions the customer may also hold in respect of CFD's in the underlying market. Please refer to Clause 3.2 of the CFD and Spot Forex Terms. The equation used by GFT to calculate your margin for options and the relevant underlying market is as follows:

$$\text{Margin} = \text{net Delta Margin} + \text{net Vega Margin}$$

$$\text{net Delta Margin} = \text{Number of CFDs} \times \text{Delta} \times \text{Underlying Margin}$$

$$\text{net Vega Margin} = \text{Number of CFDs} \times \text{Vega} \times \text{Volatility} \times \text{VolFactor}$$

Where:

$$\text{Underlying Margin} = \text{Underlying GFT Price} \times \text{IM Factor}$$

$$\text{Volatility} = \text{GFT implied volatility for the specific option}$$

$$\text{VolFactor} = \text{A multiplier.}$$

Subject to a minimum margin for all short positions. This can be found in the table above ("Min Margin Per Contract").

For non-equity options this number changes depending on the time to expiry and can be displayed graphically below... (note: for US Volatility Index options the VolFactor is 10 times greater than this graph)
